

Email Automation - Documentation

Overview

This script automates the process of sending personalized emails using Gmail SMTP. It reads data from an Excel spreadsheet and sends a plain-text email to each recipient.

Dependencies

- pandas: For reading the Excel file
- smtplib: For connecting to the SMTP server
- email.mime: For crafting the email

Workflow

1. Load Excel File
2. Set up SMTP and authenticate
3. Compose emails with personalized names
4. Send each email
5. Close the server

How to Run

- Install dependencies with pip
- Run the Python script
- Ensure Gmail is configured for SMTP access
